BOMBSHELTER TARP SET-UP

1. Fix a section of cord (appr. 8’) to the back corner of the tarp (at “A” above). Anchor this cord to a stake or tie it around a tree to fix the tarp in place.

2. Attach a long section of cord to the attachment point along the midline closest to the corner tie-in (at “B” above). Wrap the cord around the tree and then through the remaining attachment points along the midline of the tarp (at “C” and “D” above). Vary the configuration of the tarp by wrapping the cord lower or higher around the tree. Wrap lower to keep the wind out, and higher for more head space.

3. Tie a separate piece of cord to a tree at the front end of the tarp into a loop (not shown above). Move the loop up the tree and clip a mini-carabiner to it. Pass the long section of cord that passes through the attachment points through the carabiner on the loop of cord, and then tie the cord off to the attachment point at “E” above. Attaching a carabiner to “E” facilitates tightening and adjusting tension on the tarp.

4. Pull out the side points and tighten the tarp.
